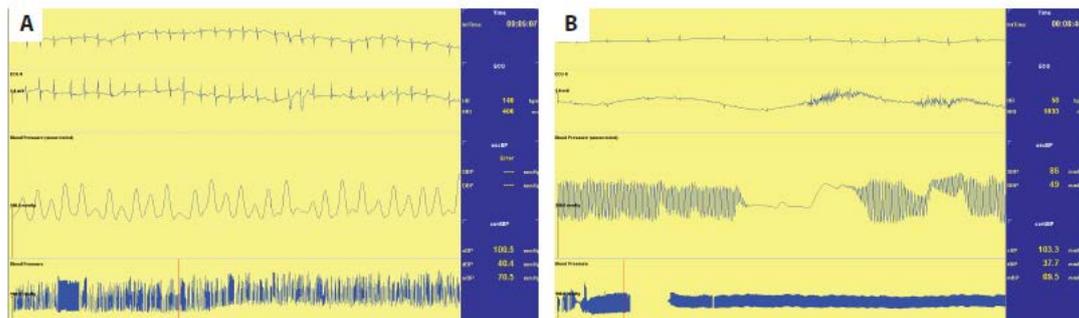

Figure 1. Noninvasive continuous beat-to-beat blood pressure monitoring during head-up tilt test in a patient with syncope. Nitroglycerin administration (0.4 mg sublingually), loss of consciousness and syncope; a decrease in sinus rhythm to 20 bpm, followed by 4 seconds of sinus asystole was documented. **A.** Control tilt test was performed at 1-month follow-up; after 10-minute nitroglycerine administration, presyncope with nausea occurred; a decrease in sinus rhythm from 100 bpm to 58 bpm and in blood pressure from 120/73 mm Hg to 103/37 mm Hg was noted. **B.** Heart rhythm and blood pressure are pre-sented in the bottom strips
